USER MANUAL DOCUMENTATION

CHAPTER 1: INSTALLATION

Installation can be done in few different ways depending on your server configuration. The plugin is with above the regular size because of the included multimedia it exceed the normal limits of php upload size (8 Mb or 32 Mb). If your php is configured to accept larger files you won't experience any disturbing while installing it the regular way.

REGULAR INSTALLATION (WHILE PHP UPLOAD LIMIT IS CONFIGURED TO MORE THAN 45 MB)

Go to your "**Plugins**" tab (/wp-admin/plugins.php) and click on the button Add New positioned on the top of your plugin list. From the menu that appears select the Search | **Upload** | Featured | Popular | Newest | Favorites tab "**Upload**". Pick the "**Choose file**" button from the form bellow and select the archive that is named

Install a plugin in .zip format

If you have a plugin in a .zip format, you may install it by uploading it here.

Choose File | No file chosen   Install Now
No file chosen

weather-background.zip and select "**Install now**". When it finishes your plugin will be installed in the plugins folder. After this click on

"**Activate plugin**". You can do it right after the installation or from the "**Plugins**" tab. If error occures it might be because your php upload limit is configured to less than 45 Mb – in this case look at the next chapter how to upload your plugin manually.
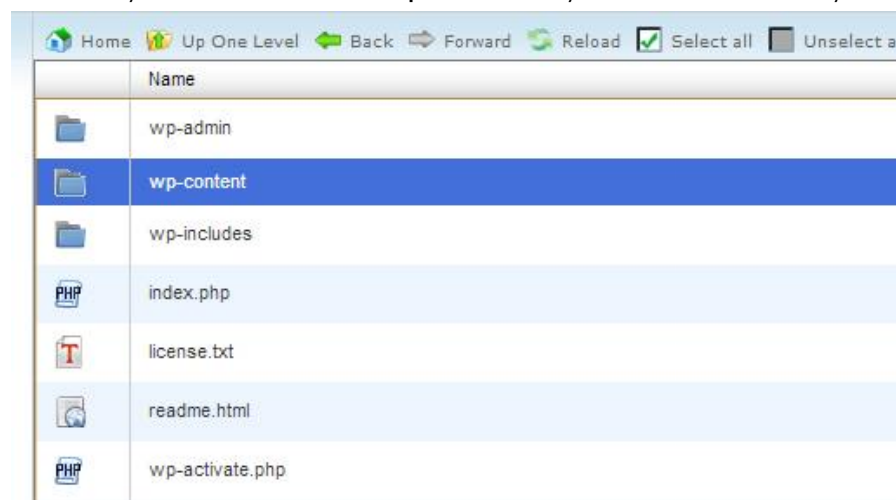

MANUAL INSTALLATION (FOR MOST SERVERS WITH LESS THAN 45 MB UPLOAD LIMIT)

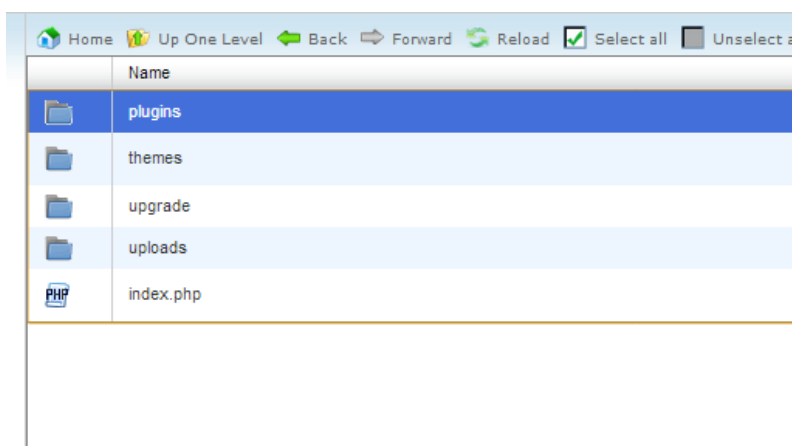

If you are using shared hosting in 99% of the cases it uses cPanel which makes the installation much faster. Go to your cPanel from your shared hosting navigation. Find section "**Files**" and select "**File Manager**". A floating window will appear where you can select which version of the file manager we should use (the newest versions of cPanel have only a selector for directory). We directly select our web site and click the "**Go**" button. We go to our main directory and select the folder "**wp-content**". If you need more exercise you

can just read the cPanel documentation – in general it works as a desktop file manager you can open folders with double click, use the right click to open a sub-menus and so on.

Next we select the "**plugins**" folder. All your plugins are located in your plugins folder. Even if your regular installation has failed there should be no problem to instantly start a manual installation – it never creates and files or folders if regular installation has failed.

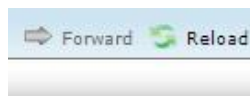

We open the "**plugins**" folder and select the "**Upload**" button from the toolbar on the top.

A new window will appear. Select the "**Choose file**" button and upload the archive named **weather-background.zip.** Right after selecting the archive it will automatically upload in the "**plugins**" folder. A fair warning – do not reload the page before the upload finishes. It may take while depending on your upload speed and connection to your hosting provider. With a good connection to the
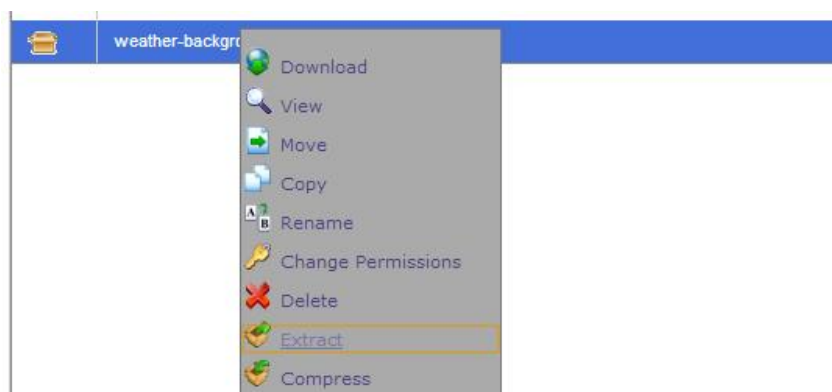

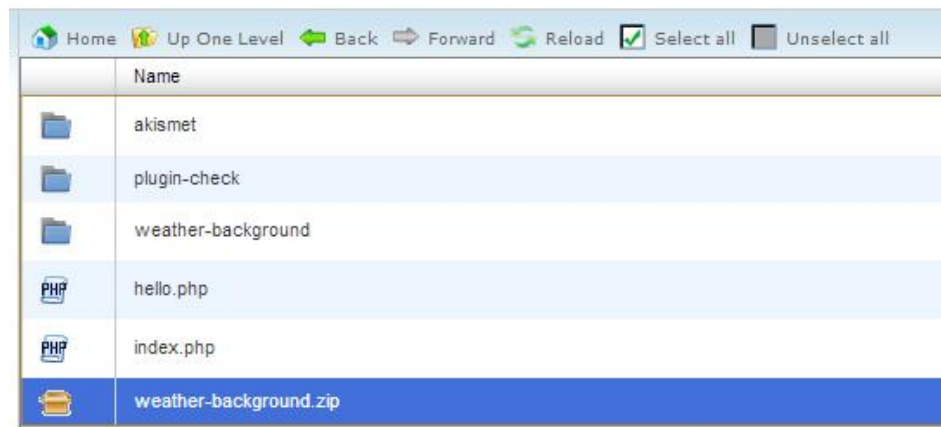

hosting provider and regular upload limits it takes up to 10-15 seconds. After it finishes close the upload tab. Go back to the last tab where your file manager points to the plugins folder and click on the "**Reload**" button.

After it reloads the page you will see the archive you've recently uploaded. Select it and right click on it.
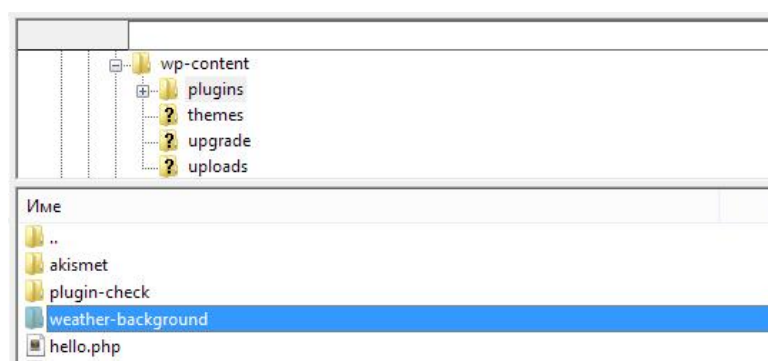

From the drop down menu that appears select the "**Extract**" option. After that a floating window will appear. Click on "**Extract files**" without changing anything.

That's all your plugin is now installed. Instead the right button you can use the "**Extract**" button from the top toolbar. It could have problems with the right button menu for some browsers.
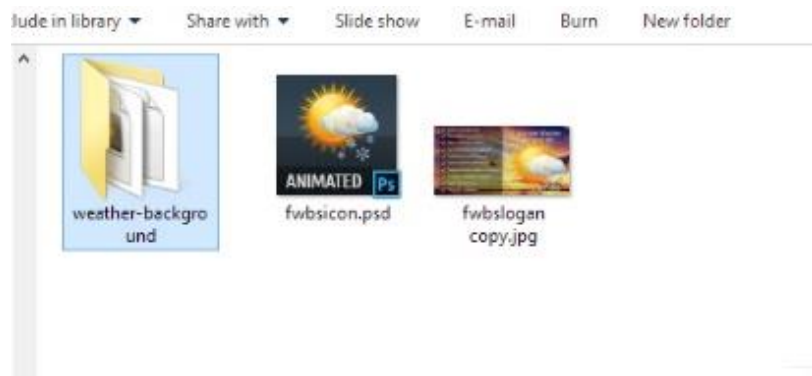

In case you don't want to use cPanel you can use any FTP solution from the Internet. The most popular one is Filezilla (click on the link to visit the official site). If you have it or just downloaded it you can connect to your hosting (for more details if you don't know how to that refer to Filezilla documentation or your hosting provider for connection details). After you've connected you can do the same steps.

- Open your site directory
- Go to /wp-content/plugins

- Now extract your archive named **weather-background.zip** on any place in your computer.

- Select the extracted folder and drag it in the "**plugins**" folder in Filezilla (you can also use the side menu in your Filezilla client – refer to the Filezilla documentation)

That's all now you have only to go to your admin panel and activate the plugin.

ALL CONFIGURATION OPTIONS ARE PLACED UNDER THE "FSB WEATHER" CATEGORY
